**Under Guidance of-  
Prof Padma K Padmanabhan**

## Initial System - SPC/E Water Model

- NVT Ensemble
- Dimensions of Box - 24 Armstrong
- Number of water molecules - 461
- Temperature - 315 K
- Density of water-  $0.997 \text{ g/cm}^3$

Arranged in periodic manner

## Replacing 8 molecules

- 8 water molecules were replaced.
- 8 neutral species with different sigma (Lennard Jones Potential parameter) values were added.
- System has 453 water molecules and 8 hydrophobic species.

## Simulation

---

- ⦿ Energy Minimization
- ⦿ Thermal Equilibration of 1 ns
- ⦿ Production simulation of 9 ns
- ⦿ Total run of 10 ns

after equilibration

after production

replaced  
molecules initially

after minimization

SIMULATION OF 10 NS

# Minimization of Energy

Geometric minimization for  $\sigma = 2.500$

Geometric minimization for  $\sigma = 3.166$  (comparable to oxygen)

Geometric minimization for  $\sigma = 3.500$

Geometric minimization for  $\sigma = 4.000$

# Temperature Over Time

Sigma = 2.500

Sigma = 3.166

Sigma = 3.500

Sigma = 4.000

Behaviour of the temperature of the system with simulation time

# Potential Energy and Total Energy Over Time

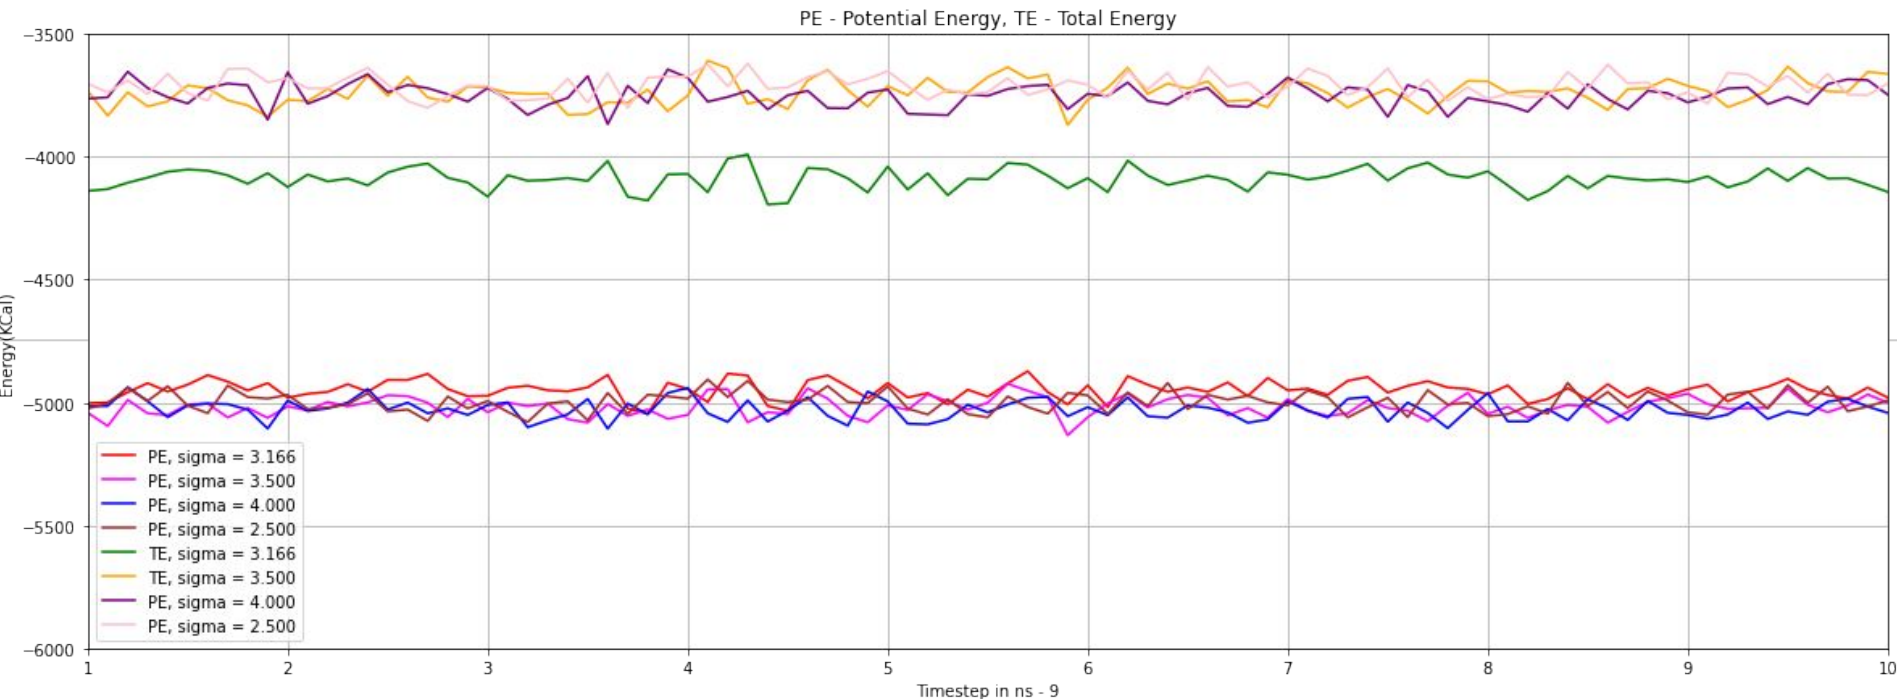

Sigma = 3.166

Behaviour of the Potential and Total Energy of the system over simulation time

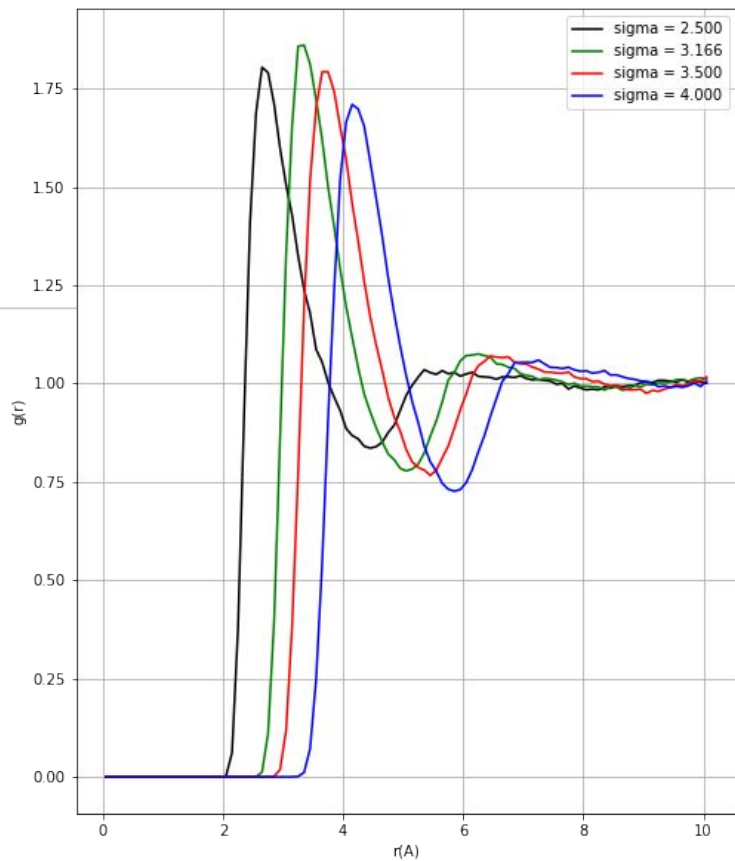

# Potential Energy and Total Energy Over Time

Behaviour of the Potential and Total Energy of the system over simulation time with varying sigma values

# Radial Distribution Function and Running Coordination Number

Hydrophobic Species - Oxygen RDF & RCN

## RDF plot comparison from Literature

**Figure 7.** Solute–oxygen radial distribution functions of uncharged Li, Rb, F, and I.

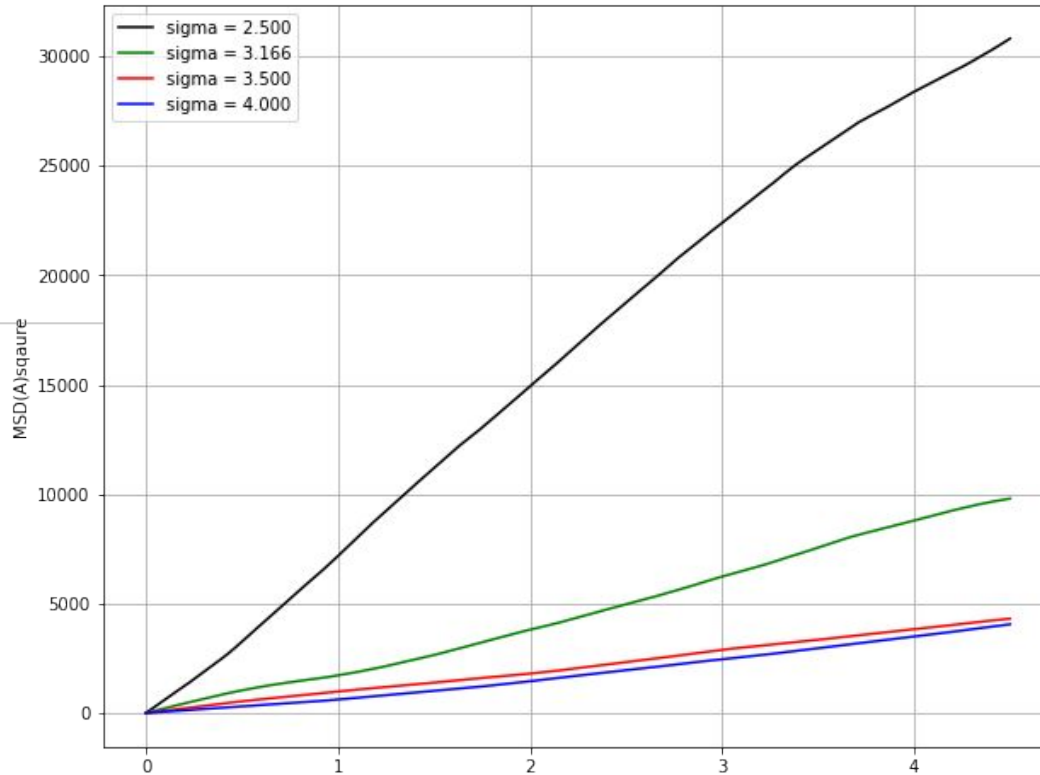

Reference : Solvent Structure, Dynamics, and Ion Mobility in Aqueous Solutions at 25 °C

# Radial Distribution Function and Running Coordination Number

Hydrophobic Species - Hydrogen RDF & RCN

# Mean Square Displacement (MSD)

MSD plots for different sigma values

## Diffusion Coefficient (D)

$$D = \text{MSD}/6t$$

From the above relation, the diffusion coefficient is calculated from the slope of MSD vs time graph,

sigma	Diffusion Coefficient in ( $10^{-9} \text{ m}^2 \text{ s}^{-1}$ )
2.5	11.93
3.166	3.74
3.5	1.58
4	1.52

## Variation of Diffusion Coefficient over Sigma values

The Diffusion Coefficient values are observed to saturate with increasing sigma values

## Diffusion Coefficient (D) comparison from Literature

Reference : A Molecular Dynamics Simulation of the Diffusivity of O<sub>2</sub> in Supercritical Water

# Coordination Number Density

Larger sigma values have more spread out distribution

# Coordination Number Density

Average coordination number is increasing with increase in sigma values

# Spatial Distribution Function

Sigma = 2.500

Sigma = 3.166

For Isovalue = 18

# Spatial Distribution Function

Sigma = 3.500

Sigma = 4.000

For Isovalue = 18

## Conclusion

- RDF plots with variation of sigma values is in agreement qualitatively with reference.
- Diffusion coefficient is exceptionally high for  $\sigma = 2.500$ .
- MSD plots are fairly straight.
- Coordination number gets more largely spread out with increase in sigma values.
- Average Coordination Number also increase with increase in sigma values.
- Spatial Density Function has more well defined shells with decreasing sigma values.

# Thanks!
